Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.In this book, I explain the thermodynamic kinematics of the cosmic microwave background radiation (CMBR) inflation pressure required to pull open huge spherical shells composed of mainly nuclear fusionable materials. The specific context for the balloon topologies is the modeling of the requirements for the achievement of super-Planck Powers via simultaneous detonation of unit cells comprising the spherical shells. Herein, the conjectured balloons have a one-way from outside to the inside negative electromagnetic refraction index which provides the pulling pressure required to hold the subject balloons open against gravitational collapse. Methods for precisely timing the detonation of the unit cells are considered but without violating the light speed limits according to Special Relativity. Additionally, other forms of fuels for balloon composition are considered such as matter-antimatter fuels, exotic QCD fuels having super-fusion yields, and nuclear isomers. Also provided in the book are whimsical conjectures as suggestions regarding fundamental cosmological ramifications based on the results of spheres modeled to have the mass and radius of the baryonic content of the observable universe. Additionally, I consider possibilities for center of mass frame collisions of hollow spheres of substantially identical mass, thickness, and radius at velocities very close to that of light for which one sphere is made of Standard Model baryonic matter and the other sphere is made of mirror matter analogues. Upon spatial enmeshment of two colliding spheres, the mirror matter sphere is assumed to be immediately converted to Standard Model matter by a cellular distribution of clock and change mechanisms by differential volumetric element over the mirror matter sphere composition. The interaction of both spheres is assumed to yield complete explosive reactions on times scales in the background...
